## Arrays

CS 121: Data Structures

## START RECORDING

## Outline

- Attendance quiz
- Basic concepts of arrays
- Typical array-processing code
- Two-dimensional arrays

Attendance Quiz

## Attendance Quiz: Conditionals and Loops

- Scan the QR code, or find today's attendance quiz under the "Quizzes" tab on Canvas
- Password: to be announced in class
- After five minutes, we will discuss the answers

## Attendance Quiz: Conditionals and Loops

- Write your name
- Translate the following pseudocode into a Java program, Conditionals.java

```
Repeat the following ten times (use a for loop):
    Print the number of times the program has looped so far
    If the program has looped more than 7 times but isn't on the final iteration, print
    "Almost done!"
    If the program is on its final iteration, print "All done!"
```

COMPUTER SCIENCE SEDGEWICK/WAYNE

3. Arrays

- Basic concepts
- Typical array-processing code
- Two-dimensional arrays

## Basic building blocks for programming

any program you might want to write

## Your first data structure

A data structure is an arrangement of data that enables efficient processing by a program.

An array is an indexed sequence of values of the same type.

## Examples.

- 52 playing cards in a deck.
- 100 thousand students in an online class.
- 1 billion pixels in a digital image.
- 4 billion nucleotides in a DNA strand.
- 73 billion Google queries per year.
- 86 billion neurons in the brain.
- 3 command line arguments.

Main purpose. Facilitate storage and manipulation of data.

## Processing many values of the same type

## 10 values, without arrays

```
doub7e a0 = 0.0;
double a1 = 0.0;
doub7e a2 = 0.0;
doub7e a3 = 0.0;
double a4 = 0.0;
doub7e a5 = 0.0;
doub7e a6 = 0.0;
doub7e a7 = 0.0;
doub7e a8 = 0.0;
doub7e a9 = 0.0;
*
a4 = 3.0;
a8 = 8.0;
-
double x = a4 + a8;
```

10 values, with an array
double[] a;
a = new double[10];
$\mathrm{a}[4]=3.0$;
$\mathrm{a}[8]=8.0$;
double $x=a[4]+a[8] ;$

1 million values, with an array
double[] a;
a = new double[1000000];
$a[234567]=3.0 ;$
$a[876543]=8.0$;
double $x=a[234567]+a[876543] ;$
scales to handle huge amounts of data
tedious and error-prone code

## Memory representation of an array

An array is an indexed sequence of values of the same type.

A computer's memory is also an indexed sequence of memory locations. $\longleftarrow$ stay tuned for many details - Each primitive type value occupies a fixed number of locations.

- Array values are stored in contiguous locations.

for simplicity in this lecture, think of a as the memory address of the first location the actual implementation in Java is just slightly more complicated.

| $a[0]$ | $a[1]$ | $a[2]$ | $a[3]$ | $a[4]$ | $a[5]$ | $a[6]$ | $a[7]$ | $a[8]$ | $a[9]$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

Critical concepts

- Indices start at 0.
- Given i, the operation of accessing the value a[i] is extremely efficient.
- The assignment $b=a$ makes the names $b$ and a refer to the same array.

## Java language support for arrays

Basic support
operation
Declare an array
Create an array of a given length
Refer to an array entry by index
Refer to the length of an array
typical code
doub7e[] a;
$\mathrm{a}=$ new double[1000];
$\mathrm{a}[\mathrm{i}]=\mathrm{b}[j]+\mathrm{c}[\mathrm{k}]$;
a. 1 ength;

Initialization options

## Copying an array

To copy an array, create a new array, then copy all the values.

```
double[] b = new double[a.length];
for (int i = 0; i < a.length; i++)
        b[i] = a[i];
```

Important note: The code $b=a$ does not copy an array (it makes $b$ and a refer to the same array).

```
double[] b = new double[a.length];
b = a;
```

$\square$

## Programming with arrays: typical examples

Access command-line args in args array
For brevity, N is a. 1 length and b .1 length in all this code

```
int stake = Integer.parseInt(args[0]);
int goal = Integer.parseInt(args[1]);
int trials = Integer.parseInt(args[2]);
```

```
Copy to another array
doub7e[] b = new double[N];
for (int i = 0; i < N; i++)
    b[i] = a[i];
```

Create an array with N random values

```
double[] a = new double[N];
for (int i = 0; i < N; i++)
    a[i] = Math.random();
```

## Print array values, one per line

```
for (int i = 0; i < N; i++)
    System.out.println(a[i]);
```

Compute the average of array values

```
doub7e sum = 0.0;
for (int i = 0; i < N; i++)
    sum += a[i];
double average = sum / N;
```

Find the maximum of array values

```
doub7e max = a[0];
for (int i = 1; i < N; i++)
    if (a[i] > max) max = a[i];
```

## Pop quiz 1 on arrays

Q. What does the following code print?

```
public class PQarray1
{
    public static void main(String[] args)
    {
        int[] a = new int[6];
        int[] b = new int[a.length];
        b = a;
        for (int i = 1; i < b.length; i++)
            b[i] = i;
        for (int i = 0; i < a.length; i++)
        System.out.print(a[i] + " ");
        System.out.println();
        for (int i = 0; i < b.length; i++)
        System.out.print(b[i] + " ");
        System.out.println();
    }
}
```

## Pop quiz 1 on arrays

Q. What does the following code print?

```
public class PQarray1
{
    public static void main(String[] args)
    {
        int[] a = new int[6];
        int[] b = new int[a.length];
        b = a;
        for (int i = 1; i < b.length; i++)
            b[i] = i;
        for (int i = 0; i < a.length; i++)
        System.out.print(a[i] + " ");
        System.out.println();
        for (int i = 0; i < b.length; i++)
        System.out.print(b[i] + " ");
        System.out.println();
    }
}
0 1 2 3 4 5
```

After this, b and a refer to the same array
A.

```
% java PQ4_1
```

% java PQ4_1
012345

```
012345
```

## Programming with arrays: typical bugs

Array index out of bounds double[] $a=$ new double[10];
for (int $\mathbf{i}=1$; i $<=10$; i++)
$a[i]=$ Math.random();

No a[10] (and a[0] unused)

## Uninitialized array

double[] a;
for (int $i=0 ; i<9 ; i++$ )
$a[i]=$ Math. random();
Never created the array

Undeclared variable

```
a = new double[10];
for (int i = 0; i < 10; i++)
    a[i] = Math.random();
```

What type of data does a refer to?

Image sources
http://commons.wikimedia.org/wiki/File:CERN_Server_03.jpg

- Basic concepts
- Examples of array-processing code
- Two-dimensional arrays

Example of array use: create a deck of cards

Define three arrays

- Ranks.
- Suits.

```
String[] rank = {"2", "3", "4", "5", "6", "7", "8", "9", "10", "J", "Q", "K", "A" };
String[] suit = { "&", "\diamond", "४", "^" };
String[] deck = new String[52];
```

- Full deck.

Use nested for loops to put all the cards in the deck.

|  |  | $i$ |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 |
| rank | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | J | Q | K | A |

|  | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 | 19 | 20 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| deck | $2 \%$ | $3 \%$ | 4\% | 5\% | 6\% | 7\% | $8 \%$ | 9\% | 10\% | J\% | Q4 | K* | A\% | 2 | $3 \checkmark$ | 4 | 5 | 6 | 7 | 8 | 9 |

```
```

for (int j=0; j<4; j++) % better style to use rank.length and suit.length clearer in lecture to use 4 and 13

```
for (int j=0; j<4; j++) % better style to use rank.length and suit.length clearer in lecture to use 4 and 13
    for (int i = 0; i < (13; i++)
    for (int i = 0; i < (13; i++)
        deck[i + 13*j] = rank[i] + suit[j];
```

        deck[i + 13*j] = rank[i] + suit[j];
    ```

Example of array use: create a deck of cards
```

public class Deck
{
public static void main(String[] args)
{
String[] rank = {"2", "3", "4", "5", "6", "7", "8", "9", "10", "J", "Q", "K", "A" };
String[] suit = { "\&", "\&", "ゅ", "^" };
String[] deck = new String[52];
for (int j = 0; j < 4; j++)
for (int i = 0; i < 13; i++)
deck[i + 13*j] = rank[i] + suit[j];
for (int i = 0; i < 52; i++)
System.out.print(deck[i] + " ");
System.out.println();
}
}

```
```

% java Deck

```
% java Deck

2* 3* 4* 5* 6* 7* 8* 9* 10* J& Q& K& A& 2*
3* 4* 5* 6* 7* 8* 9* 10* J* Q* K* A* 2*
```

3* 4* 5* 6* 7* 8* 9* 10* J* Q* K* A* 2*

```

```

3a 4a 5a 6a 7a 8a 9a 10a Ja Qa Ka Aa

```
3a 4a 5a 6a 7a 8a 9a 10a Ja Qa Ka Aa
%
```

%

```

\section*{Pop quiz 2 on arrays}
Q. What happens if the order of the for loops in Deck is switched?
```

for (int j = 0; j < 4; j++)
for (int i = 0; i < 13; i++)
deck[i + 13*j] = rank[i] + suit[j];

```

```

for (int i = 0; i < 13; i++)

```
for (int i = 0; i < 13; i++)
    for (int j = 0; j < 4; j++)
    for (int j = 0; j < 4; j++)
    deck[i + 13*j] = rank[i] + suit[j];
```

    deck[i + 13*j] = rank[i] + suit[j];
    ```

\section*{Pop quiz 2 on arrays}

```

\section*{Array application: take a card, any card}

Problem: Print a random sequence of \(N\) cards.

\section*{Algorithm}

Take \(N\) from the command line and do the following \(N\) times
- Calculate a random index \(r\) between 0 and 51.
- Print deck[r].

Implementation: Add this code instead of printing deck in Deck.
```

for (int i = 0; i < N; i++)
{
int r = (int) (Math.random() * 52)
System.out.print7n(deck[r]);
}

```

Note: Same method is effective for printing a random sequence from any data collection.

\section*{Array application: random sequence of cards}
```

public class DrawCards
{
public static void main(String[] args)
{
int N = Integer.parseInt(args[0]);
String[] rank = {"2", "3", "4", "5", "6", "7", "8", "9","10", "J", "Q", "K", "A" };
String[] suit = { "\&", "४", "४", "^" };
String[] deck = new String[52];
for (int i = 0; i < 13; i++)
for (int j = 0; j < 4; j++)
deck[i + 13*j] = rank[i] + suit[j];
for (int i = 0; i < N; i++)
{
int r = (int) (Math.random() * 52);
System.out.print(deck[r] + " ");
}
System.out.println();
}
}
% java DrawCards 10

```

\section*{Array application: shuffle and deal from a deck of cards}

Problem: Print \(N\) random cards from a deck.

Algorithm: Shuffle the deck, then deal.
- Consider each card index i from 0 to 51.

- Calculate a random index \(r\) between \(i\) and 51.
- Exchange deck[i] with deck[r]
- Print the first \(N\) cards in the deck.

Implementation
```

for (int i = 0; i < 52; i++)
{
int r = i + (int) (Math.random() * (52-i))
String t = deck[r];
deck[r] = deck[i];
deck[i] = t;
}
for (int i = 0; i < N; i++)
System.out.print(deck[i]);
System.out.println();

```

Array application: shuffle a deck of 10 cards (trace)
\begin{tabular}{|c|c|c|c|c|c|c|c|c|c|c|c|c|}
\hline \multirow[b]{5}{*}{```
for (int i = 0; i < 10; i++)
{
    int r = i + (int) (Math.random() * (10-i));
    String t = deck[r];
    deck[r] = deck[i];
    deck[i] = t;
```} & \multirow[b]{2}{*}{1} & \multirow[b]{2}{*}{\(r\)} & \multicolumn{10}{|c|}{deck} \\
\hline & & & 0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 \\

Jarek Tuszyński

\section*{Coupon collector}

Coupon collector problem
- M different types of coupons.
- Collector acquires random coupons, one at a time, each type equally likely.
Q. What is the expected number of coupons needed to acquire a full collection?

Example: Collect all ranks in a random sequence of cards \((M=13)\).

Sequence

Collection

22 cards needed to complete collection

\section*{Array application: coupon collector}

\section*{Coupon collector simulation}
- Generate random int values between 0 and \(M-1\).
- Count number used to generate each value at least once.

Key to the implementation
- Create a boolean array of length \(M\). (Initially all false by default.)
- When \(r\) generated, check the \(r\) th value in the array.
- If true, ignore it (not new).
- If false, count it as new distinct value (and set \(r\) th entry to true)
```

public class Coupon
{
public static void main(String[] args)
{
int M = Integer.parseInt(args[0]);
int cards = 0; // number of cards collected
int distinct = 0; // number of distinct cards
boolean[] found = new boolean[M];
while (distinct < M)
{
int r = (int) (Math.random() * M);
cards++;
if (!found[r])
{
distinct++; % java Coupon 13
found[r] = true; 46
}
}
System.out.println(cards); % java Coupon 13
}
}
46
%

```

\section*{Array application: coupon collector (trace for \(M=6\) )}

\section*{Simulation, randomness, and analysis (revisited)}

\section*{Coupon collector problem}
- M different types of coupons.
- Collector acquires random coupons, one at a time, each type equally likely.
Q. What is the expected number of coupons needed to acquire a full collection?

Pierre-Simon Laplace 1749-1827
A. (known via mathematical analysis for centuries) About \(M \ln M+.57721\) M .
\begin{tabular}{|c|c|c|}
\hline type & M & expected wait \\
\hline playing card suits & 4 & 8 \\
\hline playing card ranks & 13 & 41 \\
\hline baseball cards & 1200 & 9201 \\
\hline Magic \(^{\text {TM }}\) cards & 12534 & 125508 \\
\hline
\end{tabular}

\section*{Remarks}
```

% java Coupon 4
11
% java Coupon 13
38
% java Coupon 1200
8789
% java Coupon 12534
125671

```
- Computer simulation can help validate mathematical analysis.
- Computer simulation can also validate software behavior. \(\qquad\) Example: Is Math. random()
simulating randomness?

\section*{Simulation, randomness, and analysis (revisited)}

Once simulation is debugged, experimental evidence is easy to obtain.

Gambler's ruin simulation, previous lecture
```

public class Gambler

```
public class Gambler
{
{
    public static void main(String[] args)
    public static void main(String[] args)
    {
    {
        int stake = Integer.parseInt(args[0]);
        int stake = Integer.parseInt(args[0]);
        int goal = Integer.parseInt(args[1]);
        int goal = Integer.parseInt(args[1]);
        int goal = Integer.parseInt(args[1]);
        int goal = Integer.parseInt(args[1]);
        int wins = 0;
        int wins = 0;
        for (int i = 0; i < trials; i++)
        for (int i = 0; i < trials; i++)
        {
        {
        int t = stake;
        int t = stake;
        while (t > 0 && t < goal)
        while (t > 0 && t < goal)
        {
        {
            if (Math.random() < 0.5) t++;
            if (Math.random() < 0.5) t++;
            else t--;
            else t--;
            }
            }
            if (t == goal) wins++;
            if (t == goal) wins++;
        }
        }
        System.out.println(wins + " wins of " + trials);
        System.out.println(wins + " wins of " + trials);
    }
    }
}
    p
```

    p
    ```

Analogous code for coupon collector, this lecture
```

public class CouponCollector
{
public static void main(String[] args)
{
int M = Integer.parseInt(args[0]);
int trials = Integer.parseInt(args[1]);
int cards = 0;
boolean[] found;
for (int i = 0; i < trials; i++)
{
int distinct = 0;
found = new boolean[M];
while (distinct < M)
{
int r = (int) (Math.random() * M);
cards++;
if (!found[r])
{
distinct++;
found[r] = true;
}
}
}
System.out.println(cards/trials);
}
}

```

\section*{Simulation, randomness, and analysis (revisited)}

Coupon collector problem
- M different types of coupons.
- Collector acquires random coupons, one at a time, each type equally likely.
Q. What is the expected number of coupons needed to acquire a full collection?

Predicted by mathematical analysis

Hypothesis. Centuries-old analvsis is correct and Math.random() simulates randomness.

- Basic concepts
- Examples of array-processing code
- Two-dimensional arrays

\section*{Two-dimensional arrays}

A two-dimensional array is a doubly-indexed sequence of values of the same type.

\section*{Examples}
- Matrices in math calculations.
- Grades for students in an online class.
- Outcomes of scientific experiments.
- Transactions for bank customers.
- Pixels in a digital image.
- Geographic data
\begin{tabular}{|c|c|c|c|c|c|c|}
\hline & 0 & 1 & 2 & 3 & 4 & 5 \\
\hline 0 & A & A & C & B & A & C \\
\hline 1 & B & B & B & B & A & A \\
\hline 2 & C & D & D & B & C & A \\
\hline 3 & A & A & A & A & A & A \\
\hline 4 & C & C & B & C & B & B \\
\hline 5 & A & A & A & B & A & A \\
\hline
\end{tabular}

Main purpose. Facilitate storage and manipulation of data.

\section*{Java language support for two-dimensional arrays (basic support)}
operation
Declare a two-dimensional array
Create a two-dimensional array of a given length
Refer to an array entry by index
Refer to the number of rows
Refer to the number of columns
Refer to row \(i\)
Refer to row \(i\)
typical code

\section*{Self-avoiding random walks}

A dog walks around at random in a city, never revisiting any intersection.
Q. Does the dog escape?

Model: a random process in an \(N\)-by- \(N\) lattice
- Start in the middle.
- Move to a random neighboring intersection but do not revisit any intersection.
- Outcome 1 (escape): reach edge of lattice.
- Outcome 2 (dead end): no unvisited neighbors.
Q. What are the chances of reaching a dead end?

Approach: Use Monte Carlo simulation, recording visited positions in an \(N\)-by- \(N\) array.

\section*{Self-avoiding random walks}

\section*{Application of 2D arrays: self-avoiding random walks}
```

public class SelfAvoidingWalker
{
public static void main(String[] args)
{
int N = Integer.parseInt(args[0]);
int trials = Integer.parseInt(args[1]);
int deadEnds = 0;
for (int t = 0; t < trials; t++)
{
boolean[][] a = new boolean[N][N];
int x = N/2, y = N/2;
while (x > 0 \&\& x < N-1 \&\& y > 0 \&\& y < N-1)
{
if (a[x-1][y] \&\& a[x+1][y] \&\& a[x][y-1] \&\& a[x][y+1])
{ deadEnds++; break; }
a[x][y] = true;
double r = Math.random();
if (r < 0.25) { if (!a[x+1][y]) x++; }
else if (r < 0.50) { if (!a[x-1][y]) x--; }
else if (r < 0.75) { if (!a[x][y+1]) y++; }
else if (r < 1.00) { if (!a[x][y-1]) y--; }
}
}
System.out.print7n(100*deadEnds/tria1s + "% dead ends");
}
}

```
\% java SelfAvoidingWalker 10100000 \(5 \%\) dead ends
\% java SelfAvoidingWalker 20100000 \(32 \%\) dead ends
\% java SelfAvoidingWalker 30100000 \(58 \%\) dead ends
\% java SelfAvoidingWalker 40100000 \(77 \%\) dead ends
\% java SelfAvoidingWalker 50100000 87\% dead ends

\% java SelfAvoidingWalker 80100000 98\% dead ends
\% java SelfAvoidingWalker 90100000 99\% dead ends
\% java SelfAvoidingWalker 100100000 99\% dead ends

\section*{Simulation, randomness, and analysis (revisited again)}

Self-avoiding walk in an N -by- N lattice
- Start in the middle.
- Move to a random neighboring intersection (do not revisit any intersection).

\section*{Applications}
- Model the behavior of solvents and polymers.
- Model the physics of magnetic materials.
- (many other physical phenomena)
Q. What is the probability of reaching a dead end?

Paul Flory
1910-1985
Nobel Prize 1974

Mathematicians and
physics researchers cannot solve the problem.

Computational models play
A. \(99+\%\) for \(N>100\) (clear from simulations).

YOU can!
an essential role in modern scientific research.

Remark: Computer simulation is often the only effective way to study a scientific phenomenon.

\section*{Your first data structure}

\section*{Arrays: A basic building block in programming}
- They enable storage of large amounts of data (values all of the same type).
- With an index, a program can instantly access a given value.
- Efficiency derives from low-level computer hardware organization (stay tuned).

Some applications in this course:
