CS.8.A.ADTs.Overview

String processing

COMPUTER SCIENCE SEDGEWICK/WAYNE PART I: PROGRAMMING IN JAVA

Abstract data types

A data type is a set of values and a set of operations on those values.

Primitive types

- *values* immediately map to machine representations
- *operations* immediately map to machine instructions.

We want to write programs that process other types of data.

- Colors, pictures, strings,
- Complex numbers, vectors, matrices,

An abstract data type is a data type whose representation is hidden from the client.

Built-in data types

A data type is a set of values and a set of operations on those values.

type	set of values	examples of values	examples of operations			
char	characters	'A' '@'	compare			
String	sequences of characters	"Hello World" "CS is fun"	concatenate			
int	integers	17 12345	add, subtract, multiply, divide			
double	floating-point numbers	3.1415 6.022e23	add, subtract, multiply, divide			
boolean	truth values	true false	and, or, not			
Java's built-in data types						

Object-oriented programming (OOP)

Object-oriented programming (OOP).

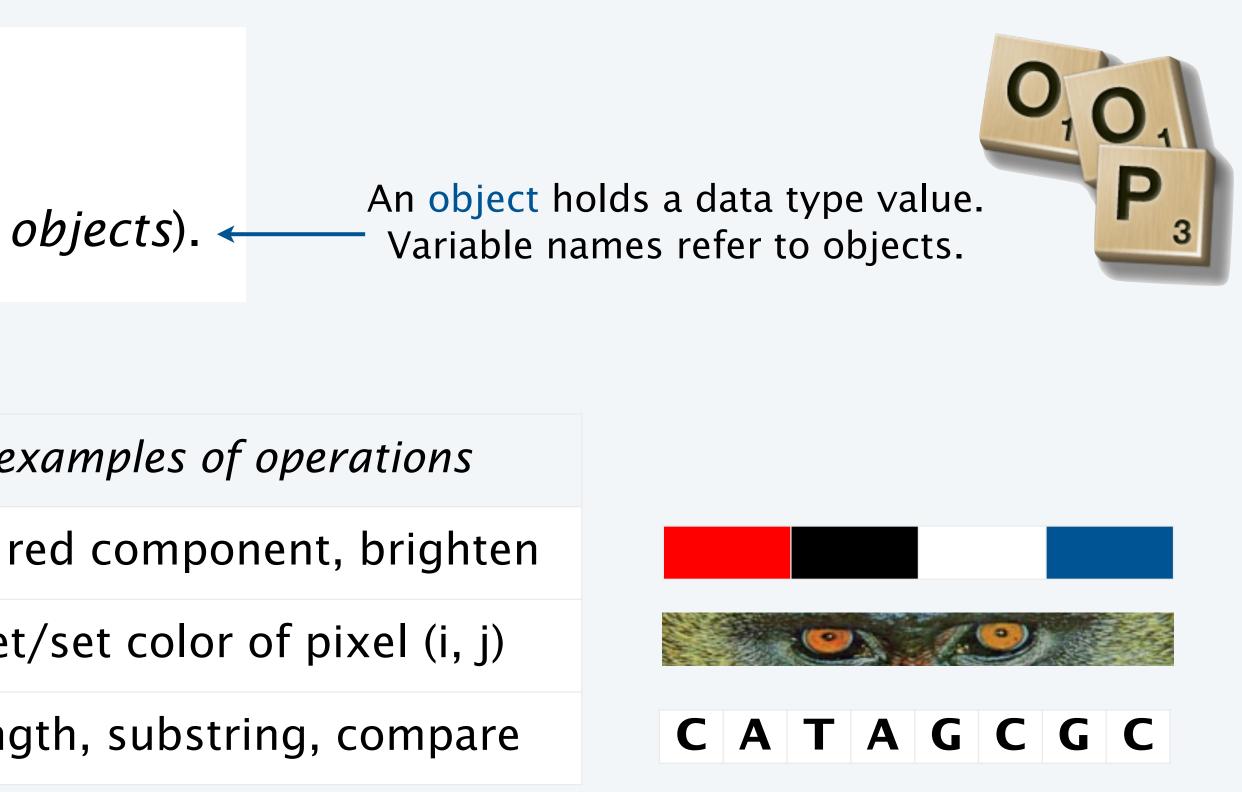

- Create your own data types.
- Use them in your programs (manipulate *objects*). -

Examples (stay tuned for details)

data type	set of values	е
Color	three 8-bit integers	get r
Picture	2D array of colors	get
String	sequence of characters	leng

Best practice: Use *abstract* data types (representation is *hidden from the client*).

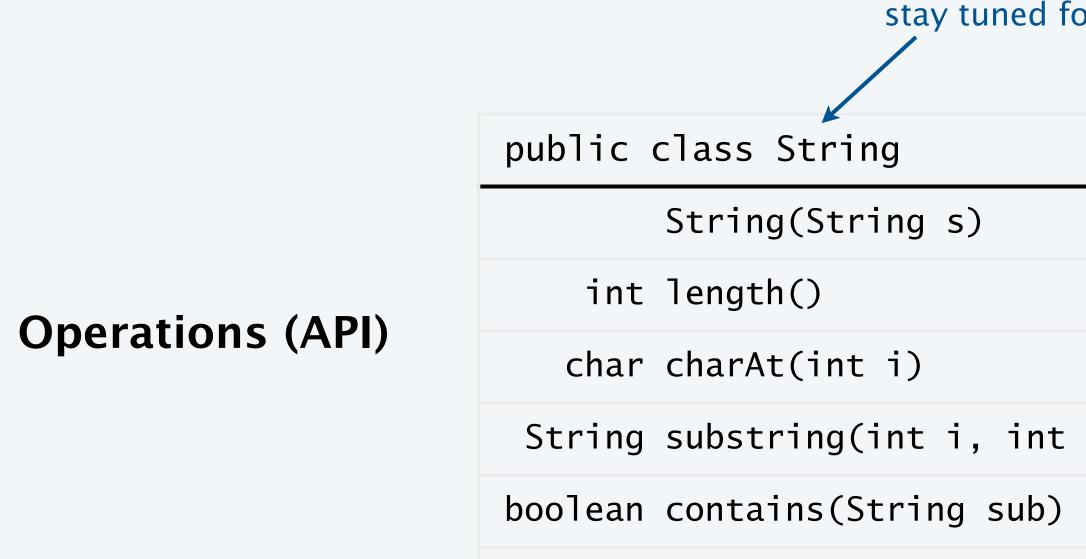

- Impact: Clients can use ADTs without knowing implementation details. • This lecture: how to write client programs for several useful ADTs • Next lecture: how to implement your own ADTs

We have *already* been using ADTs!

A String is a sequence of Unicode characters. ---- defined in terms of its ADT values (typical)

Java's String ADT allows us to write Java programs that manipulate strings. The exact representation is hidden (it could change and our programs would still work).

stay tuned for more complete API later in this lecture

	create a string with the same value
	string length
	ith character
j)	ith through (j-1)st characters
	does string contain sub?

We have *already* been using ADTs!

A In object represents an input stream of textual data.

We can read from STDIN or from files.

Operations (API)

public class In
In()
In(File file)
In(String name)
boolean isEmpty()
<pre>String readLine()</pre>
int readInt()
double readDouble()

The exact representation is hidden (it could change and our programs would still work).

Initialize input from STDIN

Initialize input from file object

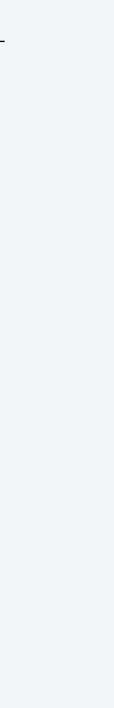

Initialize input from filename

True if input stream is empty

Read next line from input stream

Read next integer from input stream

Read next double from input stream

Using a data type: constructors and methods

To use a data type, you need to know:

- Its name (capitalized, in Java).
- How to *construct* new objects.
- How to *apply operations* to a given object.

To construct a new object

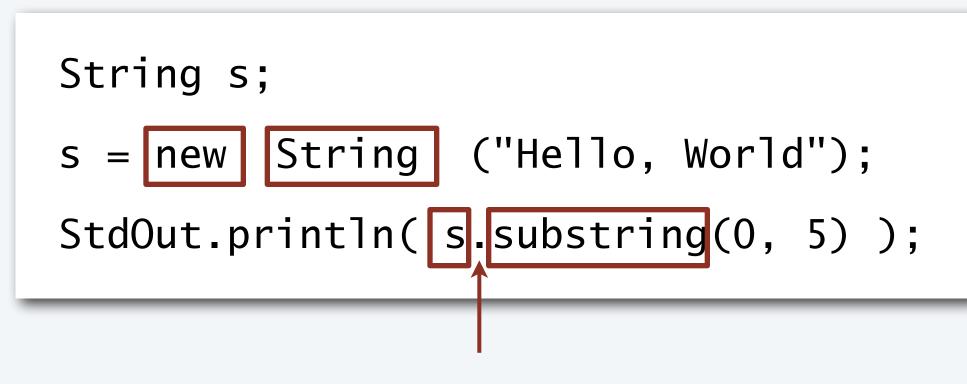

- Use the keyword new to invoke a *constructor*.
- Use data type name to specify type of object.

To apply an operation (invoke a method)

- Use object name to specify which object.
- Use the dot operator to indicate that an operation is to be applied.
- Use a method name to specify which operation.

new Building()

Pop quiz on ADTs

Q. What is a data type?

A. A set of values and a set of operations on those values.

Q. What is an abstract data type?

Pop quiz on ADTs

Q. What is a data type?

A. A set of values and a set of operations on those values.

Q. What is an abstract data type?

A. A data type whose representation is hidden from the client.

Color ADT

Color is a sensation in the eye from electromagnetic radiation.

An ADT allows us to write Java programs that manipulate color.

API (operations)

R	(
G	
В	(
	(

Values

pub

(

St

boo

					exar	nples			
(8 bits)	red intensity	255	0	0	0	255	0	119	105
(8 bits)	green intensity	0	255	0	0	255	64	33	105
(8 bits)	blue intensity	0	0	255	0	255	128	27	105
color									

blic class Color	
Color(int r, int	g, int b)
<pre>int getRed()</pre>	red intensity
<pre>int getGreen()</pre>	green intensity
<pre>int getBlue()</pre>	blue intensity
Color brighter()	brighter version of this color
Color darker()	darker version of this color
<pre>tring toString()</pre>	string representation of this color
olean equals(Color c)	is this color the same as c's?

Albers squares

Josef Albers. A 20th century artist who revolutionized the way people think about color.

Josef Albers 1888–1976

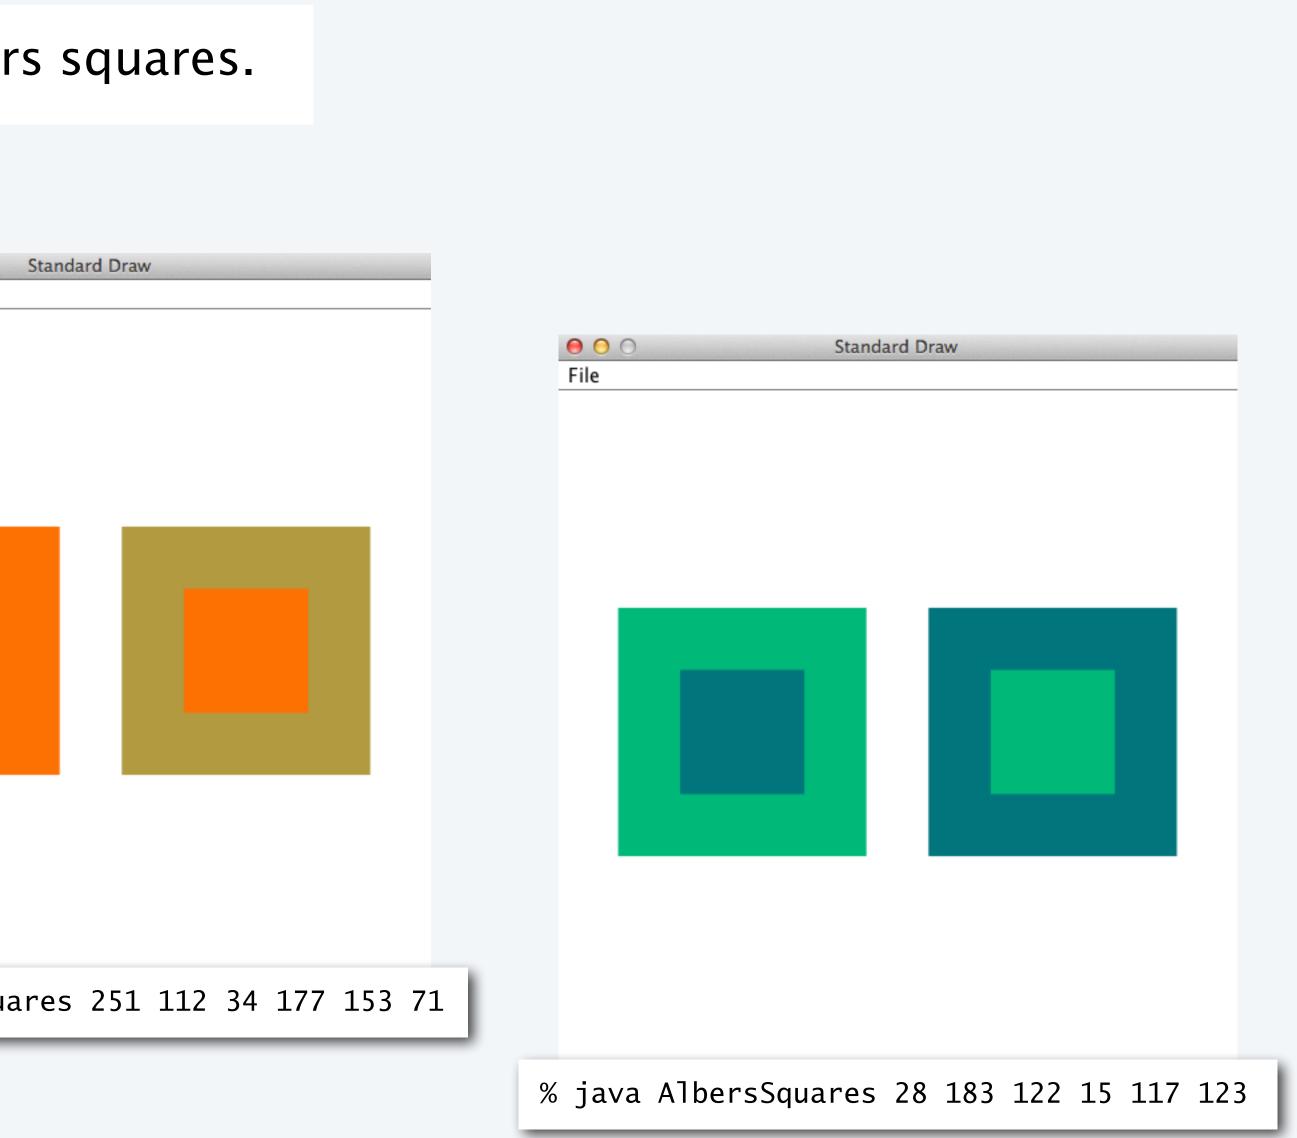

Color client example: Albers squares

Goal. Write a Java program to generate Albers squares.

00	Stand	lard Draw						
File								
							000	
							File	
							_	
java	AlbersSquares	5 0 64 128	3 105	105	105			
5								
						9	6 java	AlbersSqua
						9	6 java	AlbersSq

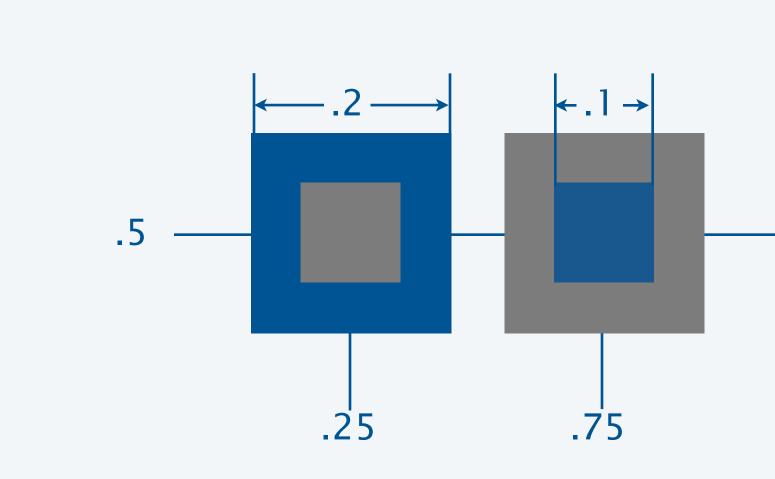

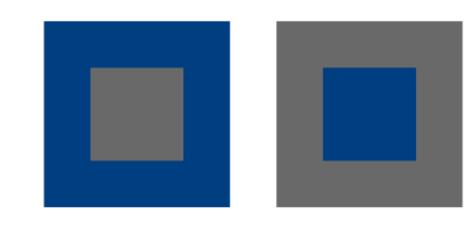

Color client example: Albers squares

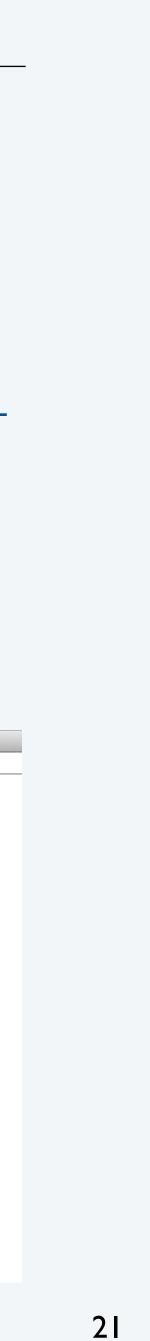

```
public class AlbersSquares
  public static void main(String[] args)
     int r1 = Integer.parseInt(args[0]);
     int g1 = Integer.parseInt(args[1]);
     int b1 = Integer.parseInt(args[2]);
     Color c1 = new Color(r1, g1, b1);
     int r2 = Integer.parseInt(args[3]);
     int b2 = Integer.parseInt(args[5]);
     Color c2 = new Color(r2, g2, b2);
     StdDraw.setPenColor(c1);
     StdDraw.filledSquare(.25, .5, .2); ---- draw first square
StdDraw.setPenColor(c2); ---- draw first square
     StdDraw.filledSquare(.25, .5, .1);
     StdDraw.setPenColor(c2);
     StdDraw.filledSquare(.75, .5, .2);
      StdDraw.setPenColor(c1);
     StdDraw.filledSquare(.75, .5, .1);
```

- draw second square

	0 0	Standard Draw	
	File		
			_
% java AlbersSquar	$0 \in 0 \in 1$	28 105 105 105	

Computing with color: monochrome luminance

Def. The *monochrome luminance* of a color quantifies its effective brightness.

NTSC standard formula for luminance: 0.299r + 0.587g + 0.114b.

```
import java.awt.Color;
public class Luminance
   public static double lum(Color c)
      int r = c.getRed();
      int g = c.getGreen();
      int b = c.getBlue();
      return .299*r + .587*g + .114*b;
   public static void main(String[] args)
      int r = Integer.parseInt(args[0]);
      int g = Integer.parseInt(args[1]);
      int b = Integer.parseInt(args[2]);
      Color c = new Color(r, g, b);
      StdOut.println(Math.round(lum(c)));
}
                             % java Luminance 0 64 128
```

	examples							
red intensity	255	0	0	0	255	0	119	105
green intensity	0	255	0	0	255	64	33	105
blue intensity	0	0	255	0	255	128	27	105
color								
luminance	76	150	29	0	255	52	58	105

Applications (next)

- Choose colors for displayed text.
- Convert colors to grayscale.

Computing with color: compatibility

Q. Which font colors will be most readable with which background colors on a display?

Rule of thumb. Absolute value of difference in luminosity should be > 128.

public static boolean compatible(Color a, Color b)
{
 return Math.abs(lum(a) - lum(b)) > 128.0;
}

	76	0	255	52
76	0	76	179	24
0	76		255	52
255	179	255		203
52	24	52	203	

Computing with color: grayscale

Goal. Convert colors to grayscale values.

Fact. When all three R, G, and B values are the same, resulting color is on grayscale from 0 (black) to 255 (white).

Q. What value for a given color?

A. Its luminance!

```
public static Color toGray(Color c)
  int y = (int) Math.round(lum(c));
  Color gray = new Color(y, y, y);
  return gray;
```

method for Luminance library

	examples							
red intensity	255	0	0	0	255	0	119	105
green intensity	0	255	0	0	255	64	33	105
blue intensity	0	0	255	0	255	128	27	105
color								
luminance	76	150	29	0	255	52	58	105
grayscale								

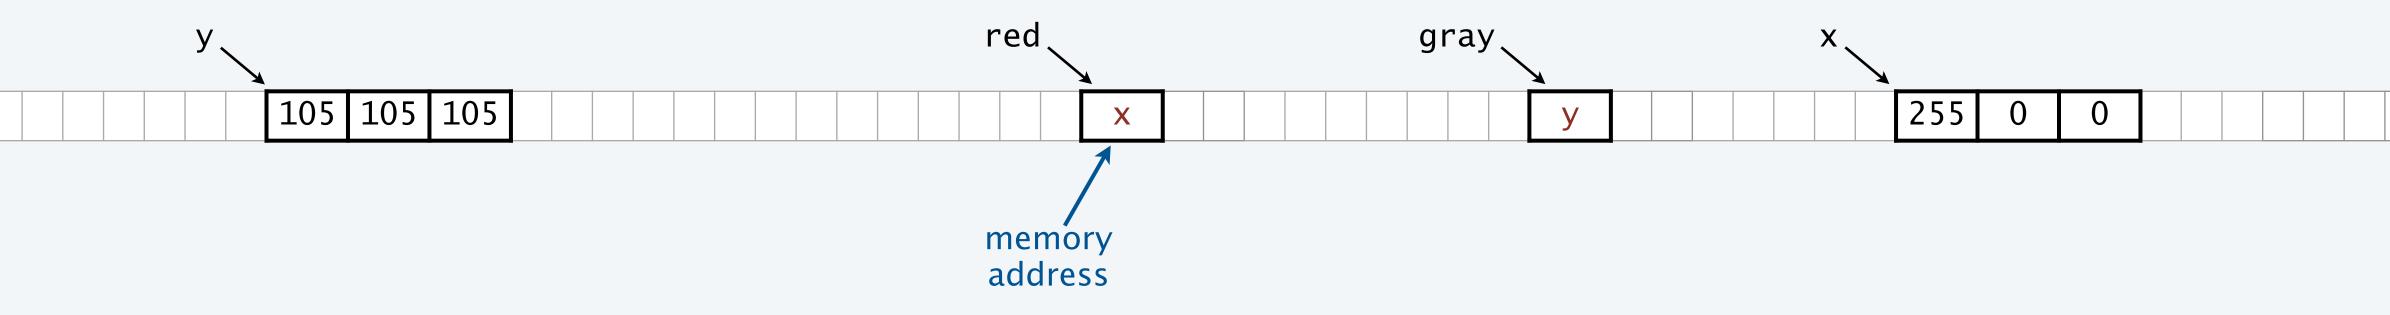

OOP context for color

Q. How does Java represent color? Three int values? Packed into one int value?

A. We don't know. The representation is hidden. It is an *abstract* data type.

Possible memory representation of red = new Color(255, 0, 0) and gray = new Color(105, 105, 105);

An object reference is analogous to a variable name.

- It is not the value but it refers to the value.
- We can manipulate the value in the object it refers to.
- We can pass it to (or return it from) a method.

ue. ct it refers to thod.

We also use object references to *invoke* methods (with the . operator)

References and abstraction

René Magritte. This is not a pipe.

Java. These are not colors.

Object-oriented programming. A natural vehicle for studying abstract models of the real world.

It is a picture of a painting of a pipe.

```
public static Color toGray(Color c)
{
   int y = (int) Math.round(lum(c));
   Color gray = new Color(y, y, y);
   return gray;
}
```

Yes it is! He's referring to the physical object he's holding. Joke would be better if he were holding a *picture* of a pipe.

CS.8.C.ADTs.Images

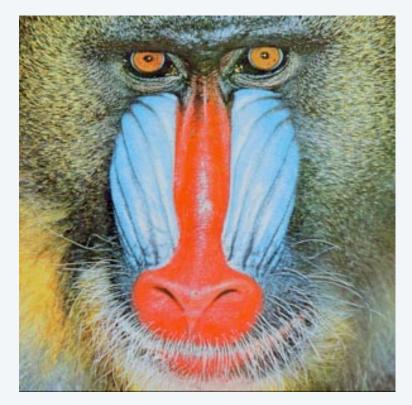

• String processing

COMPUTER SCIENCE SEDGEWICK/WAYNE PART I: PROGRAMMING IN JAVA

Picture ADT

A Picture is a 2D array of pixels.

defined in terms of its ADT values (typical)

An ADT allows us to write Java programs that manipulate pictures.

API (operations)

Pict

Pict

int widt

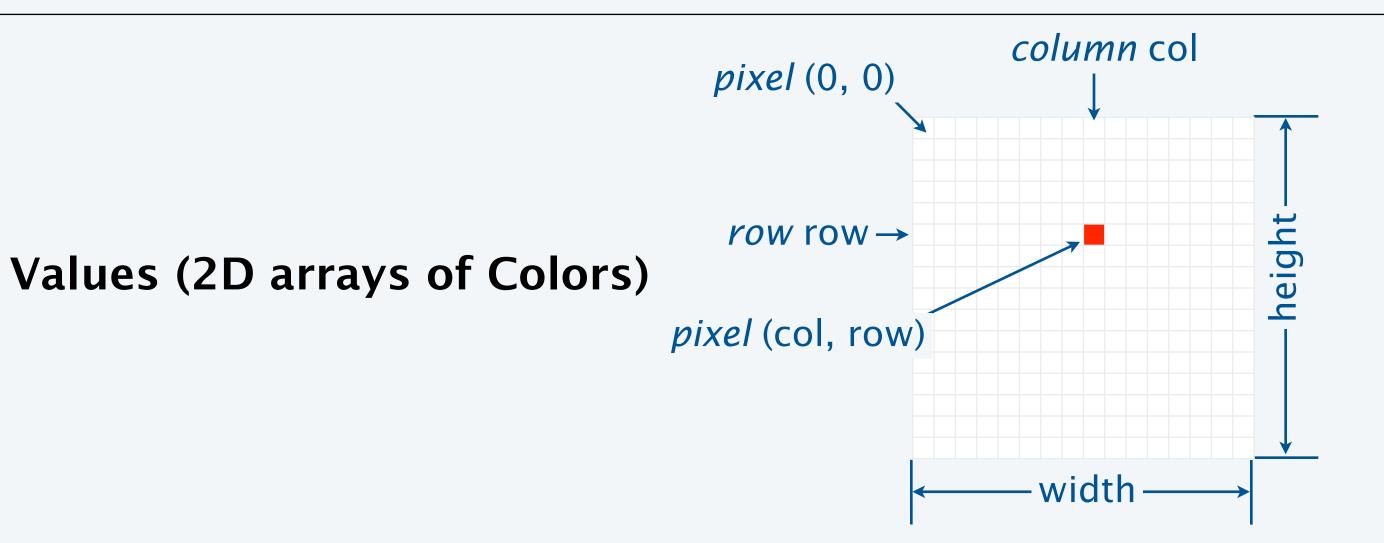

int heig

Color get(

void set(

void show

void save

public class Picture

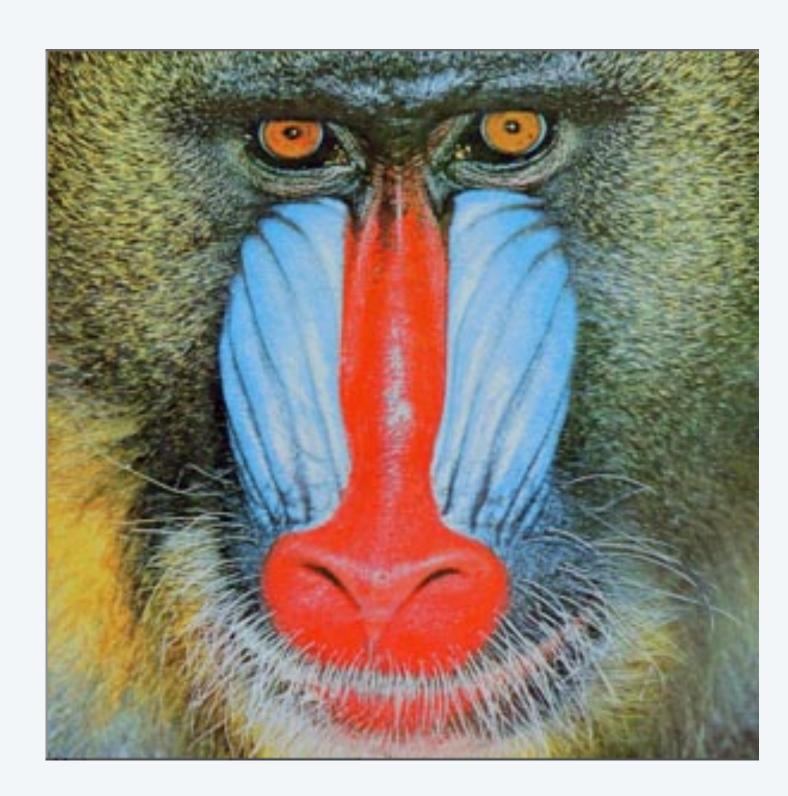

ture(String filename)	create a picture from a file
ture(int w, int h)	create a blank w-by-h picture
th()	width of the picture
ght()	height of the picture
(int col, int row)	the color of pixel (col, row)
(int col, int row, Color c)	set the color of pixel (col, row) to
w()	display the image in a window
e(String filename)	save the picture to a file

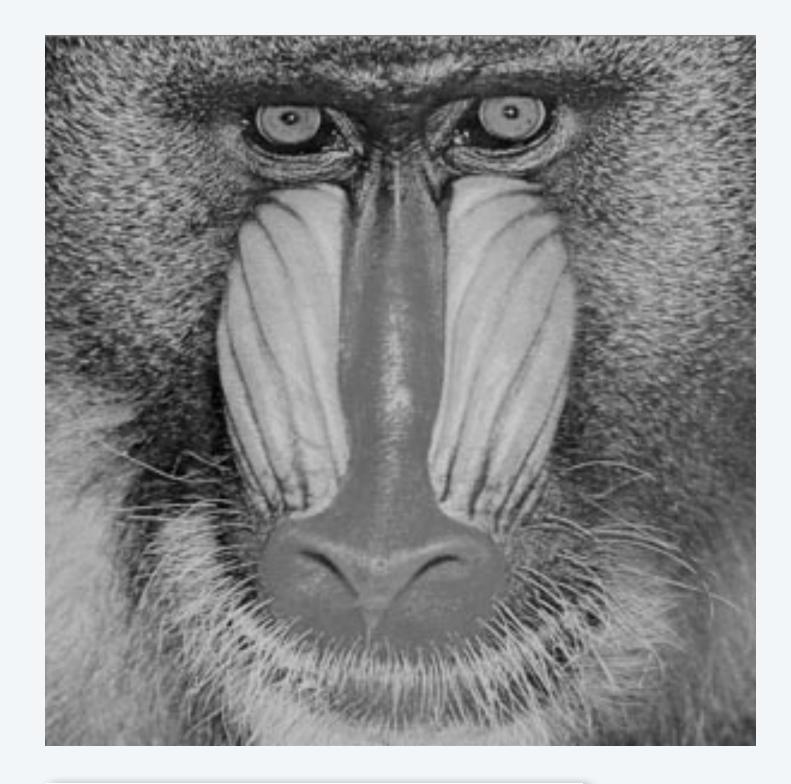

Picture client example: Grayscale filter

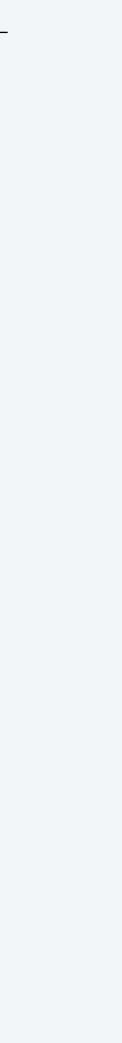

Goal. Write a Java program to convert an image to grayscale.

Source: mandrill.jpg

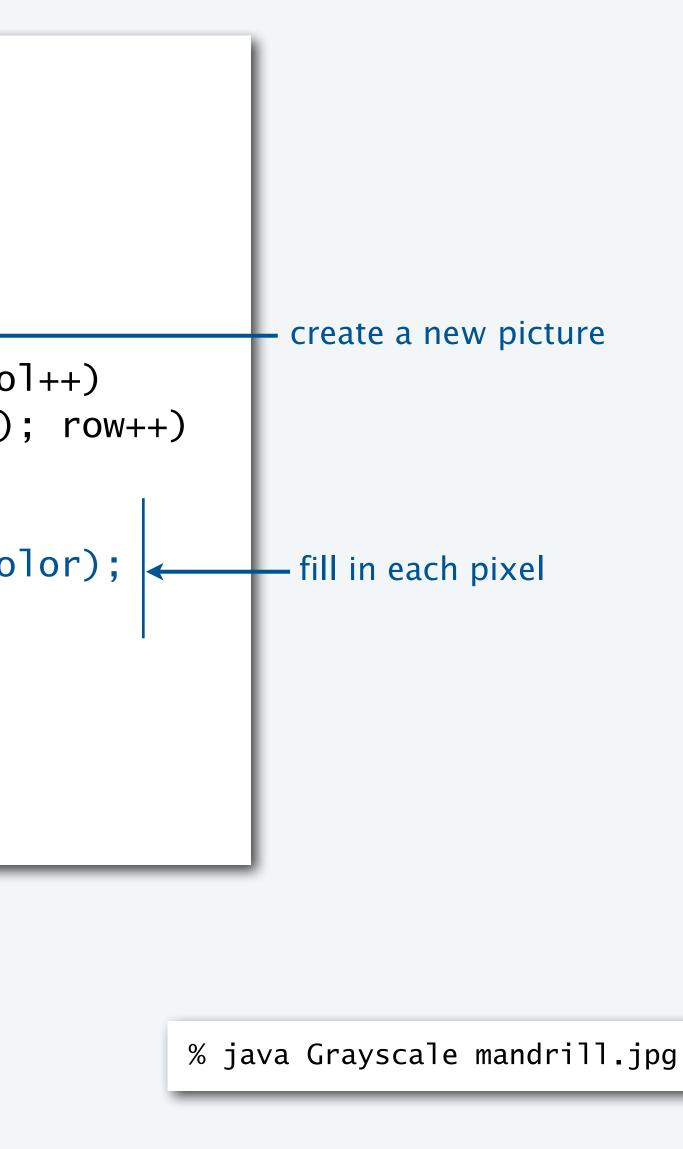

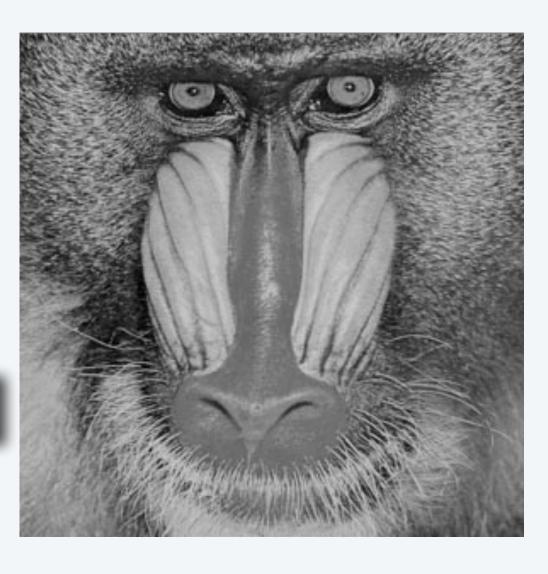

% java Grayscale mandrill.jpg

Picture client example: Grayscale filter

```
import java.awt.Color;
public class Grayscale
  public static void main(String[] args)
      Picture pic = new Picture(args[0]); 
      for (int col = 0; col < pic.width(); col++)</pre>
        for (int row = 0; row < pic.height(); row++)</pre>
            Color color = pic.get(col, row);
            Color gray = Luminance.toGray(color);
            pic.set(col, row, gray);
      pic.show();
```

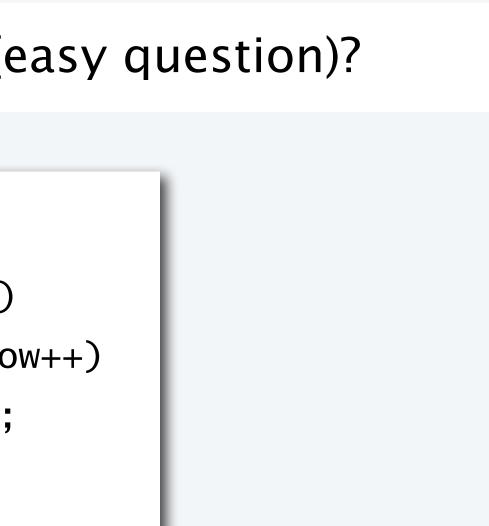

Pop quiz 1a on image processing

Q. What is the effect of the following code (easy question)?

Picture pic = new Picture(args[0]);
for (int col = 0; col < pic.width(); col++)
 for (int row = 0; row < pic.height(); row++)
 pic.set(col, row, pic.get(col, row));
pic.show();</pre>

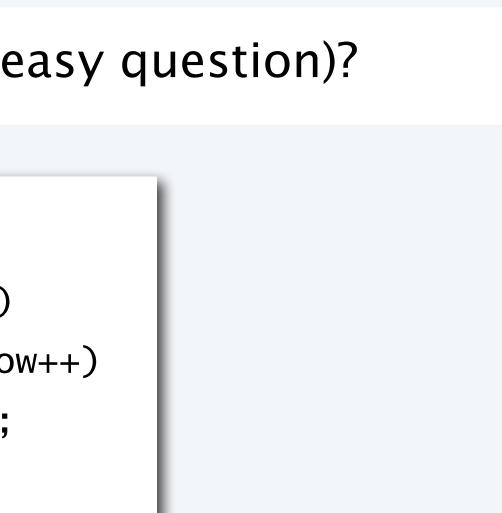

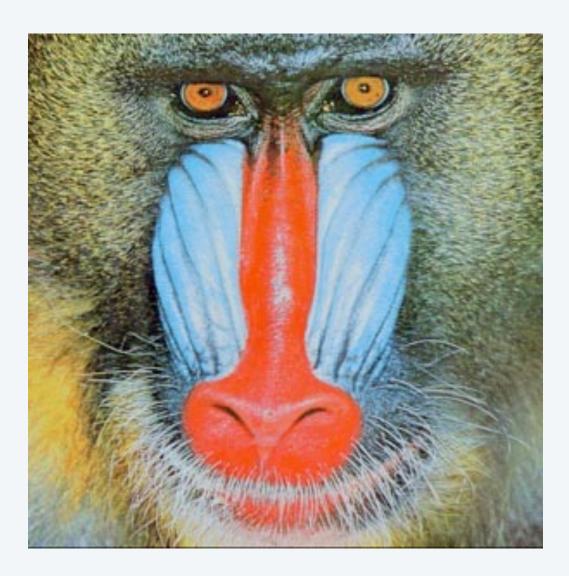

Pop quiz 1a on image processing

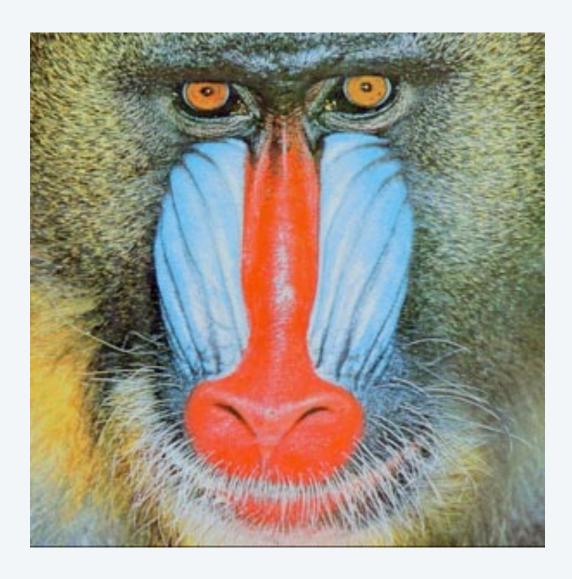

Q. What is the effect of the following code (easy question)?

Picture pic = new Picture(args[0]);
for (int col = 0; col < pic.width(); col++)
 for (int row = 0; row < pic.height(); row++)
 pic.set(col, row, pic.get(col, row));
pic.show();</pre>

A. None. Just shows the picture.

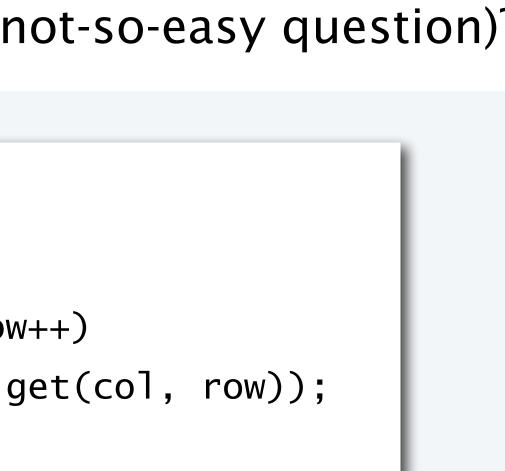

Pop quiz 1b on image processing

Q. What is the effect of the following code (not-so-easy question)?

Picture pic = new Picture(args[0]);
for (int col = 0; col < pic.width(); col++)
 for (int row = 0; row < pic.height(); row++)
 pic.set(col, pic.height()-row-1, pic.get(col, row));
pic.show();</pre>

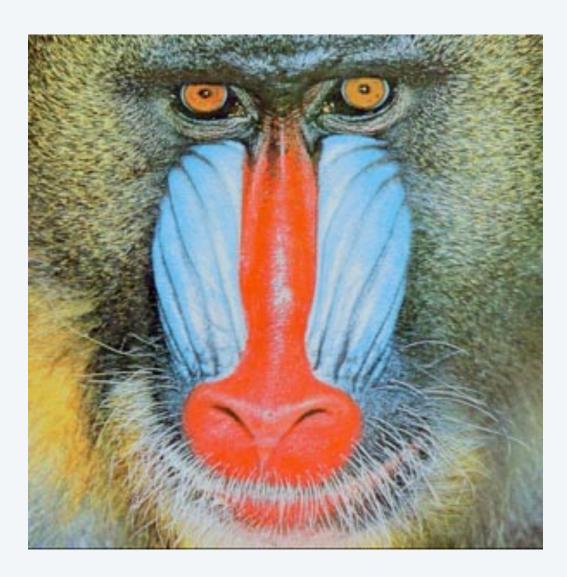

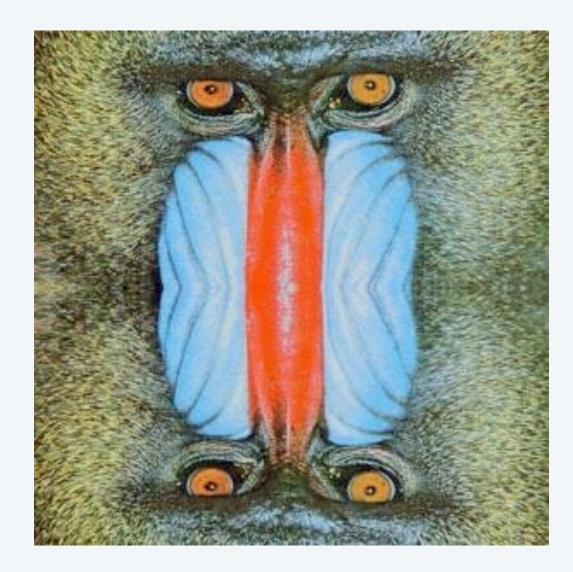

Pop quiz 1b on image processing

Q. What is the effect of the following code (not-so-easy question)?

Picture pic = new Picture(args[0]); for (int col = 0; col < pic.width(); col++)</pre> for (int row = 0; row < pic.height(); row++)</pre> pic.set(col, pic.height()-row-1, pic.get(col, row)); pic.show();

A. Tries to turn image upside down, but fails. An instructive bug!.

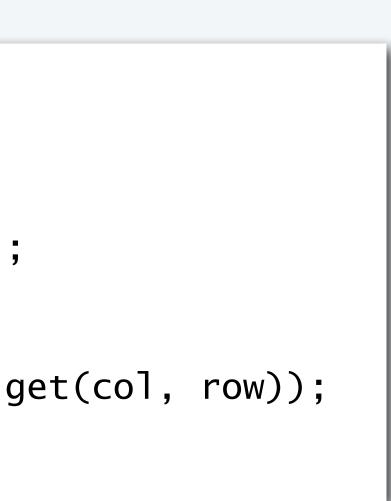

Pop quiz 1c on image processing

Q. What is the effect of the following code?

```
Picture source = new Picture(args[0]);
int width = source.width();
int height = source.height();
Picture target = new Picture(width, height);
for (int col = 0; col < width; col++)
  for (int row = 0; row < height; row++)</pre>
      target.set(col, height-row-1, source.get(col, row));
target.show();
```

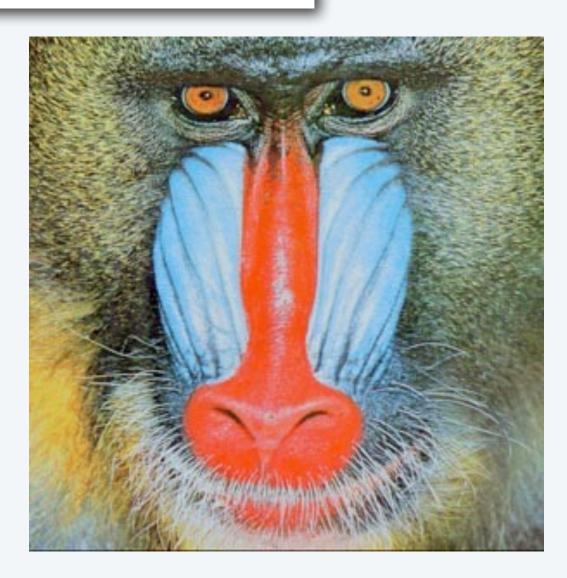

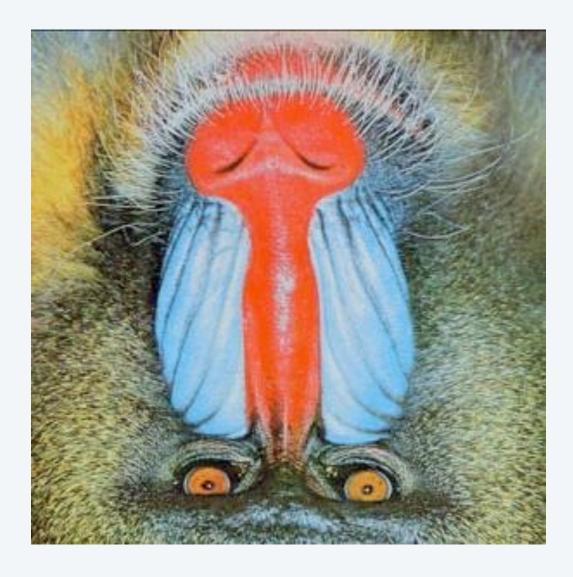

Pop quiz 1c on image processing

Q. What is the effect of the following code?

```
Picture source = new Picture(args[0]);
int width = source.width();
int height = source.height();
Picture target = new Picture(width, height);
for (int col = 0; col < width; col++)
  for (int row = 0; row < height; row++)</pre>
      target.set(col, height-row-1, source.get(col, row));
target.show();
```

A. Makes an upside down copy of the image.

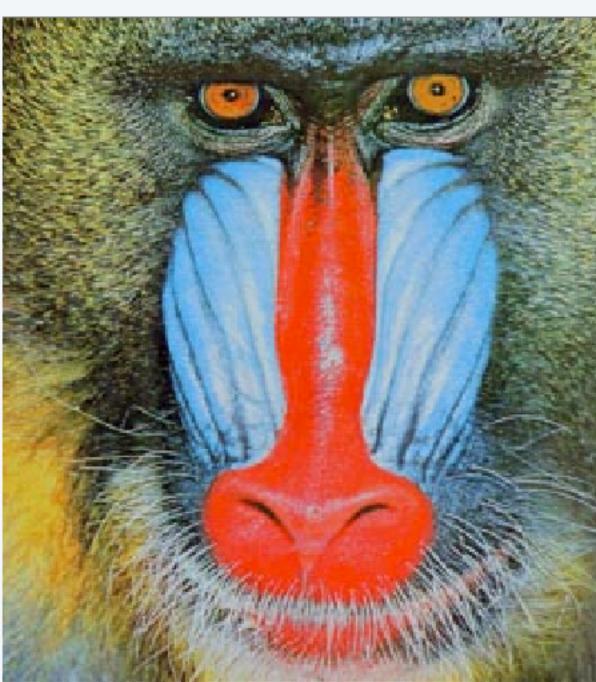

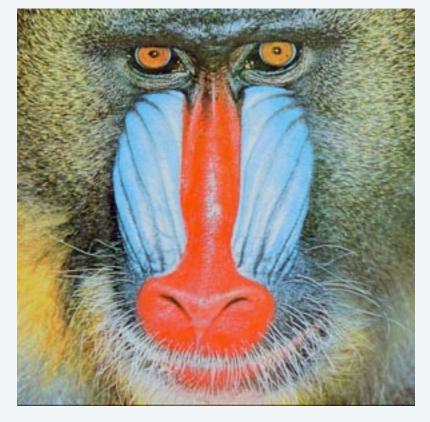

Goal. Write a Java program to scale an image (arbitrarily and independently on x and y).

500x500

% java Scale mandrill.jpg 500 500

300x300

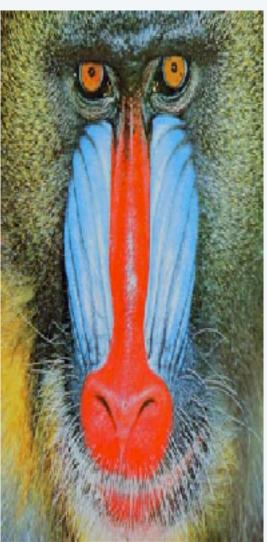

Source: mandrill.jpg

600x200

% java Scale mandrill.jpg 600 200

99x99

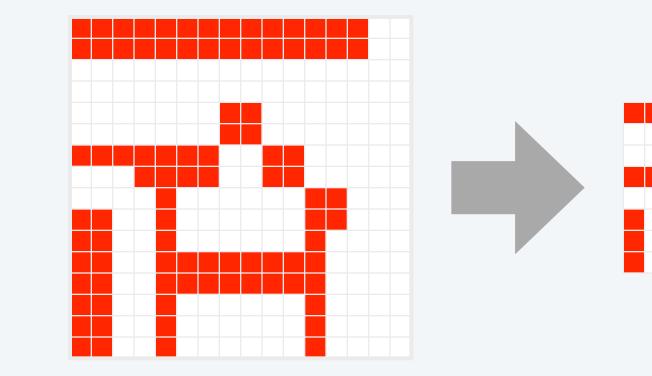

% java Scale mandrill.jpg 99 99

% java Scale mandrill.jpg 200 400

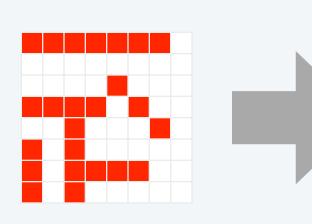

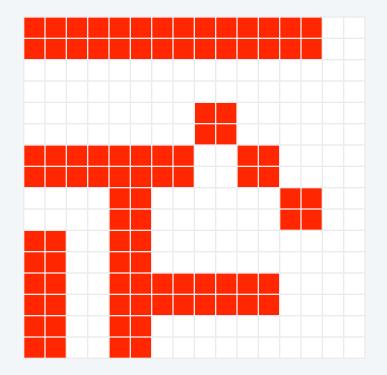

Goal. Write a Java program to scale an image (arbitrarily and independently on x and y).

Ex. Downscaling by halving. Shrink in half by deleting alternate rows and columns.

Ex. Upscaling by doubling. Double in size by replacing each pixel with four copies.

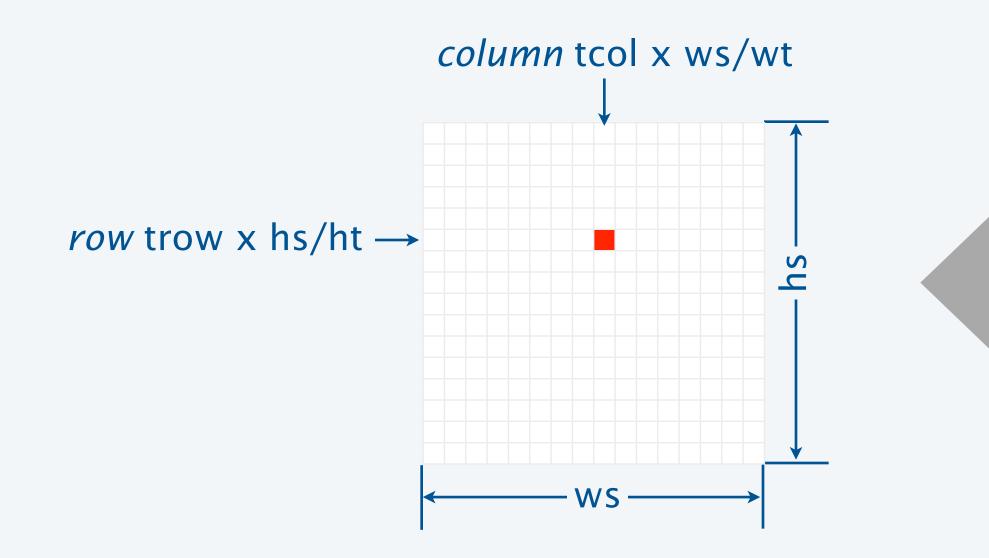

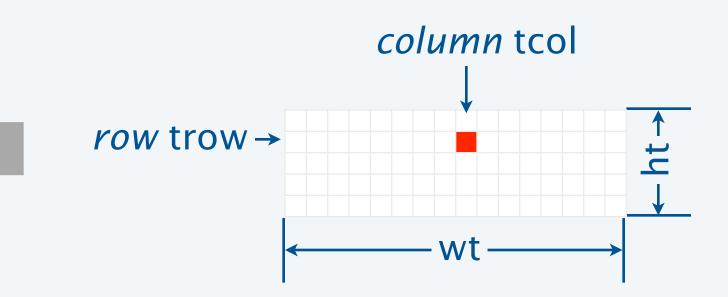

Goal. Write a Java program to scale an image (arbitrarily and independently on x and y).

A uniform strategy to scale from ws-by-hs to wt-by-ht.

- Scale column index by ws/wt.
- Scale row index by hs/ht.

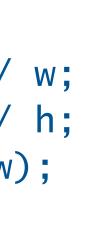

Approach. Arrange computation to compute exactly one value for each *target* pixel.

41

```
import java.awt.Color;
public class Scale
   public static void main(String[] args)
     String filename = args[0];
     int w = Integer.parseInt(args[1]);
     int h = Integer.parseInt(args[2]);
     Picture source = new Picture(filename);
     Picture target = new Picture(w, h);
     for (int tcol = 0; tcol < w; tcol++)
         for (int trow = 0; trow < h; trow++)
            int scol = tcol * source.width() / w;
            int srow = trow * source.height() / h;
           Color color = source.get(scol, srow);
            target.set(tcol, trow, color);
     target.show();
```

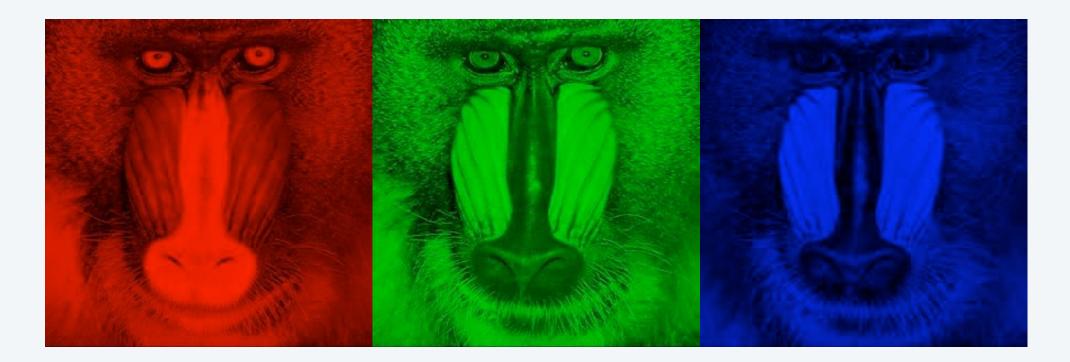

More image-processing effects

swirl filter

wave filter

RGB color separation

glass filter

Sobel edge detection

CS.8.C.ADTs.Images

- Overview
- Color
- Image processing

CS.8.D.ADTs.Strings

String processing

9. Abstract Data Types

COMPUTER SCIENCE SEDGEWICK/WAYNE PART I: PROGRAMMING IN JAVA

String ADT

A String is a sequence of Unicode characters. ---- defined in terms of its ADT values (typical)

			public class String			
	Java's ADT allows us to			String(String s)	create a string with the same value	
V	write Java programs that manipulate strings.		int	length()	string length	
			char	charAt(int i)	ith character	
			String	<pre>substring(int i, int j)</pre>	ith through (j-1)st characters	
	Operations (API)		boolean	contains(String sub)	does string contain sub?	
			boolean	<pre>startsWith(String pre)</pre>	does string start with pre?	
			boolean	endsWith(String post)	does string end with post?	
			int	<pre>indexOf(String p)</pre>	index of first occurrence of p	
			int	<pre>indexOf(String p, int i)</pre>	index of first occurrence of p after i	
			String	concat(String t)	this string with t appended	
			int	compareTo(String t)	string comparison	
		String	replaceAll(String a, String b)	result of changing as to bs		
		String[] split(String delim)	strings between occurrences of delim		
			boolean	equals(Object t)	is this string's value the same as t's?	

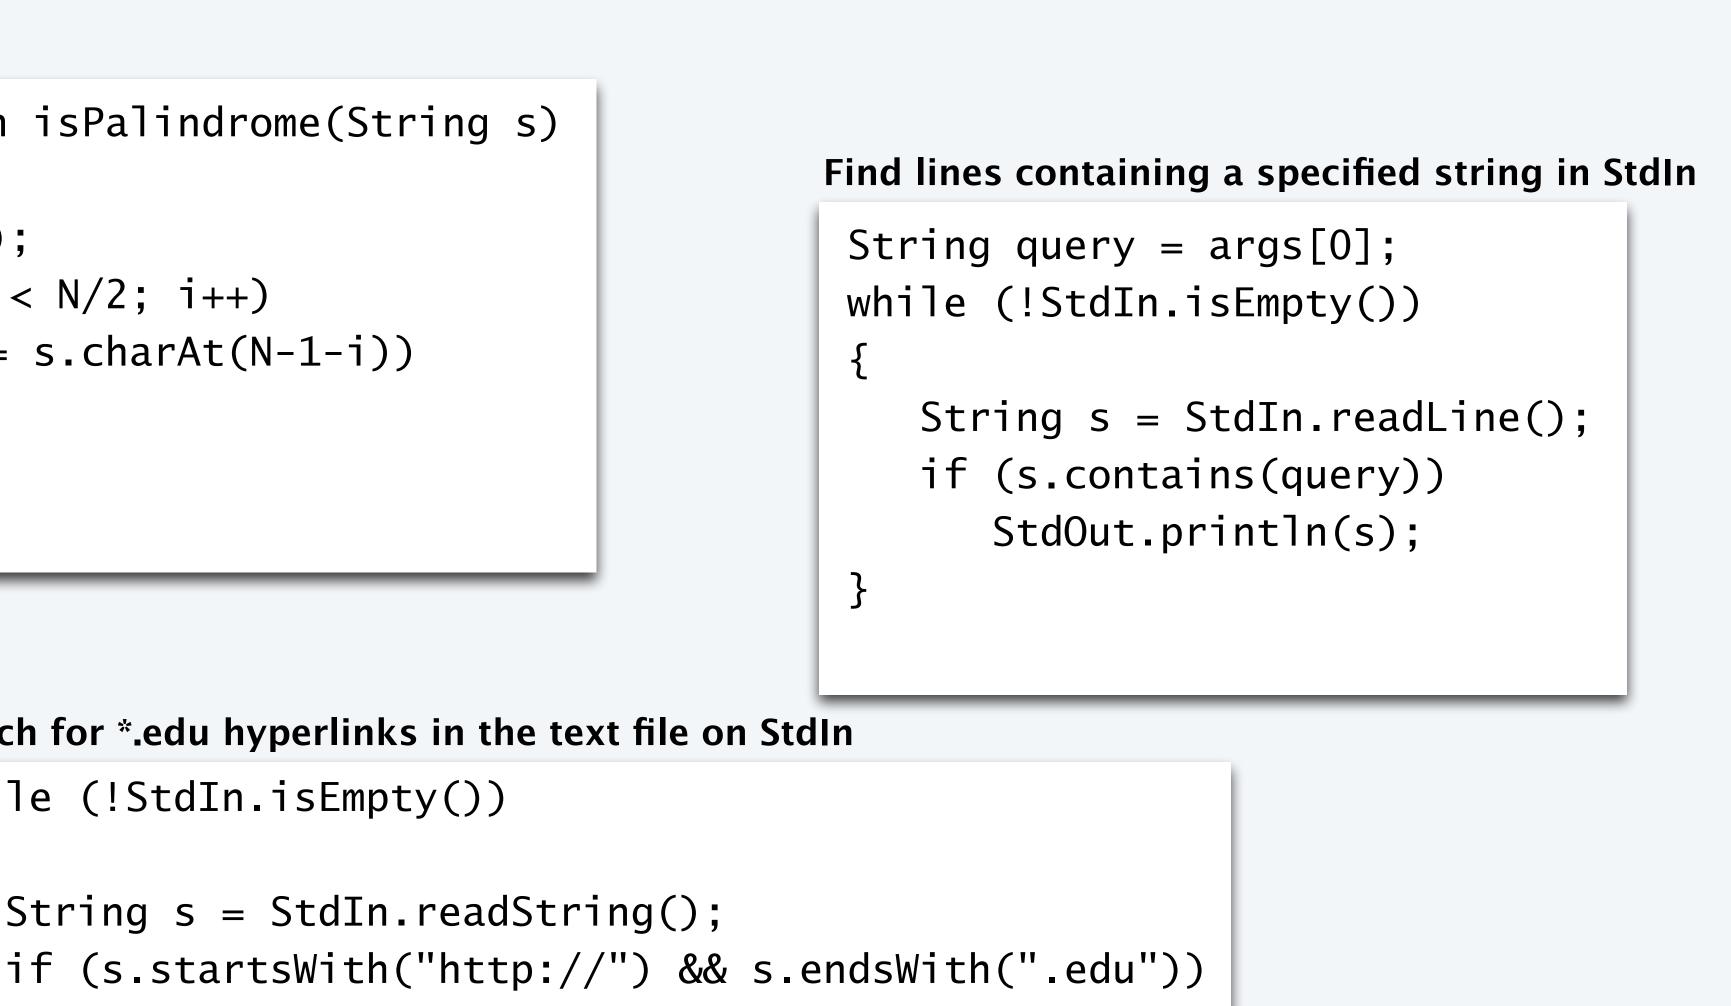

Programming with strings: typical examples

Is the string a palindrome?

```
public static boolean isPalindrome(String s)
{
   int N = s.length();
   for (int i = 0; i < N/2; i++)
   if (s.charAt(i) != s.charAt(N-1-i))
      return false;
   return true;
}
```

```
Search for *.edu hyperlinks in the text file on StdIn
while (!StdIn.isEmpty())
{
    String s = StdIn.readString();
    StdOut.println(s);
```

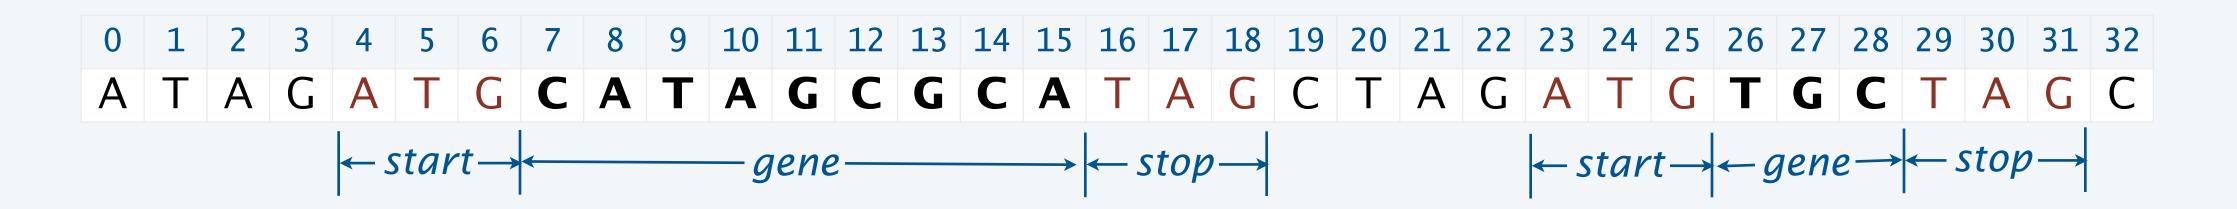

String client example: gene finding

Pre-genomics era. Sequence a human genome. Post-genomics era. Analyze the data and understand structure.

Genomics. Represent genome as a string over A C T G alphabet.

Gene. A substring of genome that represents a functional unit.

- Made of *codons* (three A C T G *nucleotides*).
- Preceded by ATG (*start* codon).
- Succeeded by TAG, TAA, or TGA (*stop* codon).

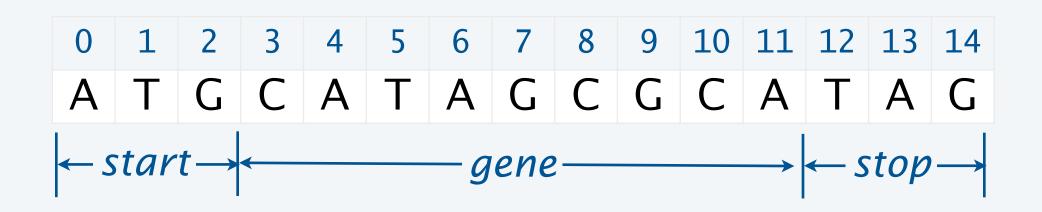

Goal. Write a Java program to find genes in a given genome.

String client warmup: Identifying a potential gene

Goal. Write a Java program to determine whether a given string is a potential gene.

% java Gene ATGCATAGCGCATAG
true
% java Gene ATGCGCTGCGTCTGTACTAG
false
% java Gene ATGCCGTGACGTCTGTACTAG
false

```
public class Gene
   public static boolean isPotentialGene(String dna)
        if (dna.length() % 3 != 0) return false;
        if (!dna.startsWith("ATG")) return false;
        for (int i = 0; i < dna.length() - 3; i+=3)
            String codon = dna.substring(i, i+3);
            if (codon.equals("TAA")) return false;
            if (codon.equals("TAG")) return false;
            if (codon.equals("TGA")) return false;
        if (dna.endsWith("TAA")) return true;
        if (dna.endsWith("TAG")) return true;
        if (dna.endsWith("TGA")) return true;
        return false;
   public static void main(String[] args)
        StdOut.println(isPotentialGene(args[0]));
```

49

String client exercise: Gene finding

Goal. Write a Java program to find genes in a given genome.

Algorithm. Scan left-to-right through dna.

- If start codon ATG found, set beg to index i.

		-			
i	codon		beg	output	
•	start	stop	beg	бигриг	
0			-1		ATAGAT
1		TAG	-1		T A G A T
4	ATG		4		AT
9		TAG	4		
16		TAG	4	CATAGCGCA	
20		TAG	-1		
23	ATG		23		
29		TAG	23	TGC	

Implementation. Entertaining programming exercise!

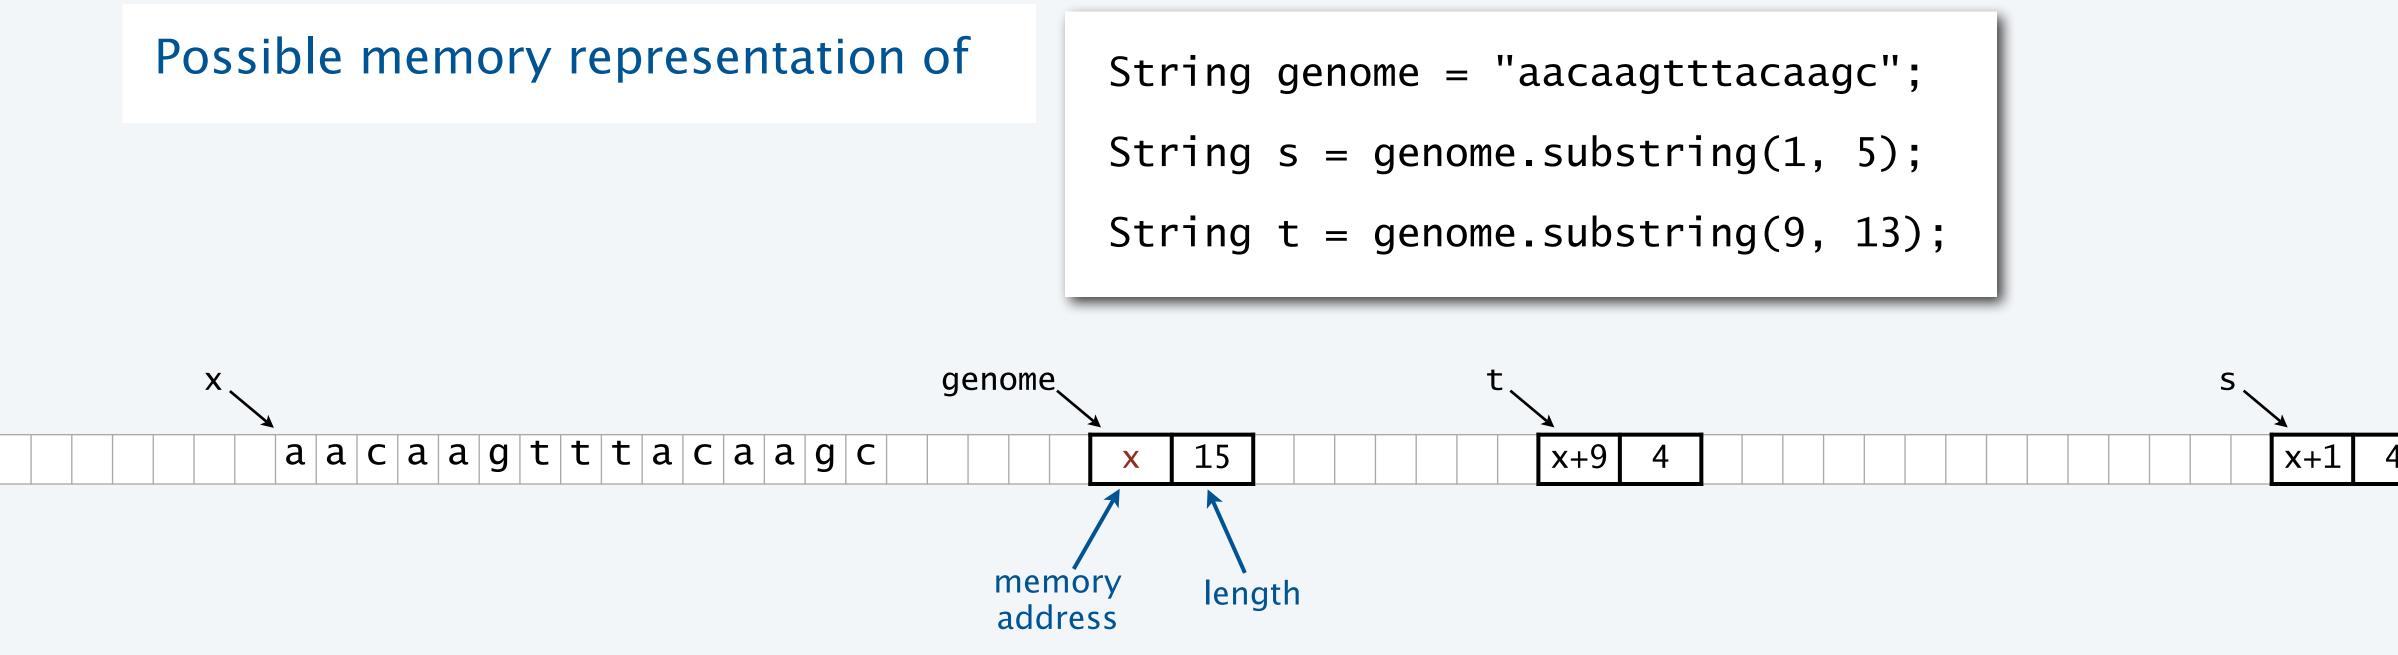

7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31 32 A T A G A T G C A T A G C A T A G C A T A G C T A G A T G C T A G C T $\leftarrow start \rightarrow \leftarrow gene \rightarrow \leftarrow stop \rightarrow \leftarrow start \rightarrow \leftarrow gene \rightarrow \leftarrow stop \rightarrow$

• If stop codon found and substring length is a multiple of 3, print gene and reset beg to -1.

remainder of input string TGCATAGCGCATAGCTAGATGTGCTAGC TGCATAGCGCATAGCTAGATGTGCTAGC **TGCATAGCGCATAGCTAG** TAGCGCATAGCTAGATGTGCTAGC TAGCTAGATGTGCTAGC TAGATGTGCTAGC ATGTGCTAGC TAGC

OOP context for strings

Implications

- s and t are different strings that share the same value "acaa".
- (s == t) is false (because it compares addresses).
- (s.equals(t)) is true (because it compares character sequences).
- Java String interface is more complicated than the API.

ŀ		

Object-oriented programming: summary

Object-oriented programming.

- Create your own data types (sets of values and ops on them).
- Use them in your programs (manipulate *objects*).

In Java, programs manipulate references to objects.

- String, Picture, Color, arrays, (and everything else) are *reference types*.
- Exceptions: boolean, int, double and other *primitive types*.
- OOP purist: Languages should not have separate primitive types.
- Practical programmer: Primitive types provide needed efficiency.

This lecture: You can write programs to manipulate colors, pictures, and strings.

An object holds a data type value. Variable names refer to objects.

T A G A T G T G C T A G C

- Next lecture: You can *define your own abstractions* and write programs that manipulate them.
